

Configuration Services

Profile IT provide a wide range of configuration services designed to help you cut costs and eliminate delays caused by hardware and software failure.

Outsourcing services to our specialist centre will allow your in-house staff to concentrate on core operational issues. The wide range of services provided by Profile IT can be fully customised to suit your requirements.

Configuration Services Available from Profile IT:

Full Product Testing - Designed to capture any DOA's and identify third-party incompatibilities.

Hardware Installation - Memory upgrades, installation of additional hard-drives and other upgrades to servers, desktops, laptops and printers. This will save you time as all hardware is delivered fully set-up to the required specification.

Software Installation - We can carry out decompression of operating systems and image configuration. This will ensure standardisation of software across multiple units, save time spent on installing software and ensures a higher quality of standard delivered to the user.

Asset Management - Customised identification tags are fixed to machines and asset inventories are completed to help you keep a track of technical goods and reduce the cost of asset tracking before, during and after deployment.

For information on any of the above, please contact your Profile IT account manager on 0121 778 6755.
